                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated mucleic acid comprising at least 10 in the specification, or its complement. The nucleic acids encode cancers associated proteins. Also included are an expression vector comprising the spoint nucleic acid cited above, a host cell comprising the above recombinant nucleic acid cited above, a host cell comprising the above comprising at least 10 contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the above comprising trame of a CA sequence selected from any of the above complement), an isolated antibody, lor its antigen binding fragment) that binds to the above polypeptide, a pharmaceutical composition comprising the above polypeptide, a pharmaceutical composition comprising the above polypeptide, a hybridoma that produces the above antibody and a pharmaceutical composition comprising the above complement, an electron complement, an electron complement of a cancer cells in an individual, a method for delivering at herapeutic agent to cancer cells in an individual, a method for delivering a therapeutic agent to cancer cells in an individual, an electronic library comprising the above complement of a polypeptide (or their fragments), methods of concer cells in a call individual, a call individual, and electronic library comprising the above complement composition of a polypeptide in a test cell sample, and method for treating cancers and a method for inhibiting the expression of the activity of a CA protein (CAP), methods for detecting cancer activity or for a bioactive agent capable of modulate cativity of a CA protein (CAP), methods for detecting cancer and a method for inhibiting the expression of a polypeptide in a test cell sample, preventing and treating cancers, especially lymphoma and leavement. These may also be used in screening for agentence data for this patent did not form part of the printe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  HQETPVYLGATAGMRLLRMESEBLADRVLDVVERSLSNYPFDFQGARIITGQEBGAYGWI 180

The invention relates to CD39-like polypeptides (CD39-like nucleotide-triphosphatese; NTPase) and their corresponding polynucleotides. The invention also relates to a method for making CD3b proteins. The methods and compositions of the invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of the CD39-like polypeptide, such as HIV infection, hepatitis, multiple sclerosis, systemic lupus erythematosus, rheumatoid arthritis, Guillain-Barre syndrome, thyroiditis, diabetes, myasthenia gravis, graft-versus-host disease (GHVD) and asthma. The present sequence is the human CD39 protein. Note: This sequence is described in the specification as being the same as the human CD39 protein represented in SEQ ID NO: 13 of the sequence listing, however the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SLYIYKWPAEKENDTGVVHQVEECRVKGPGISKFVQKVNEIGIYLTDCMERAREVIPRSQ 120

The invention relates to a novel pharmaceutical composition active on angiogenesis comprising an endothelial cell nucleic acid whose expression is induced by an angiogenic factor and inhibited by an angiostatic agent or its sinduced by in angiostatic agent or its complement or fragment, a polypeptide sequence encoded by the nucleic acid or a molecule which binds to the polypeptide expression of the nucleic acid or a molecule which binds to the polypeptide sequence. The invention is used to diagnose, prognose or treat an angiogenic disorder in a mammal, particularly a human. The disorder is particularly tumor vascularization, a retinopathy, rheumatoid arthritis, crohn's disease, atherosclerosis, overy hyperstimulation, psoriasis, endometriosis associated with neovascularization, restenosis due to angioplassy, overproduction of tissue due to cicatifsation, a peripheral 120 Compositions for diagnosing, prognosing and treating anglogenic disorders including tumor vascularization and heart disease, comprise nucleic acid or polypeptide differentially expressed in anglogenesis. 9 61 vascular disease, hypertension, vascular inflammation, Raymaud disease, aneurism, arterial restenosis, thrombophlebitis, ischemia, angina, myocardial infarction, chronic heart disease, cardiac congestion or macular degeneration due to age or osteoporosis. This sequence corresponds to a protein encoded by a differentially expressed DNA used in the composition of the invention. ovary hyperstimulation; psoriasis; endometriosis; restenosis; angioplasty; cicatrisation; peripheral vascular disease; hypertension; vascular inflammation; Raynaud's disease; aneurism; thrombophlebitis; ischemia; angina; myocardial infarction; chronic heart disease; cardiac congestion; macular degeneration; osteoporosis. Could also be implicated in the prevention of platelet aggregation. Hydrolyzes ATP and ADP equally well.
-1- CATALYTIC ACTIVITY: ATP + 2 H(2)0 = AMP + 2 phosphate.
-1- COFACTOR: Requires calcium and magnesium.

Cell Genet. 81:287-289(1998).

-!- FUNCTION: In the nervous system, could hydrolyze ATP and other nucleotides to regulate purinergic neurotransmission. Could a be implicated in the prevention of platelet aggregation.

Hydrolyzes ATP and ADP equally well.

-!- CATALYTIC ACTIVITY: ATP + 2 H(2)0 = AMP + 2 phosphate.

-!- COPACTOR: Requires calcium and magnesium (By similarity).

-!- COPACTOR: Requires calcium and magnesium (By similarity).

-!- SUBCELLULAR LOCATION: Integral membrane protein (Potential).

J. Biol. Chem. 272:23645-23652(1997).

I. FUNCTION: In the nervous system, could hydrolyze ATP and other nucleotides to regulate purinergic neurotransmission. Could also be implicated in the prevention of platelet aggregation. Hydrolyzes ATP and ADP equally well (By similarity).

I. CATALYTIC ATTIVITY: ATP + 2 H(2)O = AMP + 2 phosphate.
I. COFACTOR: Requires calcium and magnesium (By similarity).
I. SUBGNIT: Homodimer; disulfide-linked (Probable).
I. SUBCELLULAR LOCATION: Integral membrane protein (Potential).
I. PTM: N-glycosylated.
I. SIMILARITY: Belongs to the GDAl / CD39 NTPase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Eukaryoča; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

Patent No. US20020138858A1
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: CD39/ECTO-ADPASE AS A TREATMENT FOR THROMBOTIC AND TITLE OF INVENTION: ISCHEMIC DISORDERS
FILE REFERENCE: 0575/59167
CURRENT APPLICATION NUMBER: US/09/374,586
NUMBER OF SEQ ID NOS: 2
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO 2.
